

# CUSTOM CAPABILITIES

**September 14, 2009**

In this project, we are looking at a data center that is located in an old mine. Cold air is being forced down from above the cabinets and the goal is to contain it in the front of an aisle created by two rows of cabinets. The cold air will sink into the containment area and the hot air will then be removed from the cabinets via the exhaust chimneys.

The doors and all hardware were engineered and manufactured by Great Lakes. The chimney is a customized variation of our EC series of exhaust chimneys.
